

Chapter 6 Exercises

1. Modify the AreaCircle app that you created in Tutorial 6-2. Add a procedure that clears the two TextBoxes that appear on the app's screen. Add a Button to the screen that calls the procedure.
2. Create an app that has three Label components. Create two procedures: one that displays your name in all three Labels, and another that clears the contents of all three Labels. Add Buttons to the app's screen that call each procedure.
3. Create an app that lets the user enter a number of miles and converts the input to kilometers using the following formula:
 - $\text{kilometers} = \text{miles} \times 1.60934$

The app should have a function that accepts the number of miles as an argument and returns the number of kilometers.
