

## Object Oriented Programming

In your Object Oriented Programming project, create a new class starting called **StoreMain** (see below.)

```
public class StoreMain {  
  
    public static void main(String[] args) {  
        Store dptStore = new Store();  
    }  
}
```

Using the variables defined in the **Class Store**, complete the program in **StoreMain** class so that when you finish and run the program, you get the following output:

```
Department Store  
Stock #: 437876  
Category: W  
Name: Scoop Neck Dress  
Unit Price: 148.0
```

**PS: Use the code from House class and Main class as a guide.**
