Java String Object

Create a new Java Project called Objects Oriented Programming and copy the following program.

```java
class StringTester
{

  public static void main ( String[] args )
  {
    //String str1;   // str1 is a reference to a String object.
    //String str2;   // str2 is a reference to a second String object.

    int len1, len2 ;   // the length of str1 and the length of str2

    String str1 = new String( "Green eggs") ; // create the first String

    String str2 = new String( " and ham.")  ; // create the second String

    len1 = str1.length();   // get the length of the first string

    len2 = str2 . length();   // get the length of the second string

    System.out.println("The combined length of both strings is " +
        (     +     ) + " characters" );
  }
}
```

Complete the code so that the result is:
<mark>The combined length of both strings is 19 characters</mark>
